

The Box Admin Console

Powerful, elegant tools for every IT department

Box understands that the security of your data goes well beyond encryption and physical datacenter security. To help you manage the flow of content across your business, we've built a simple, powerful toolset into the Box admin console that helps businesses of all sizes secure, manage and report on all of their employees and their content.

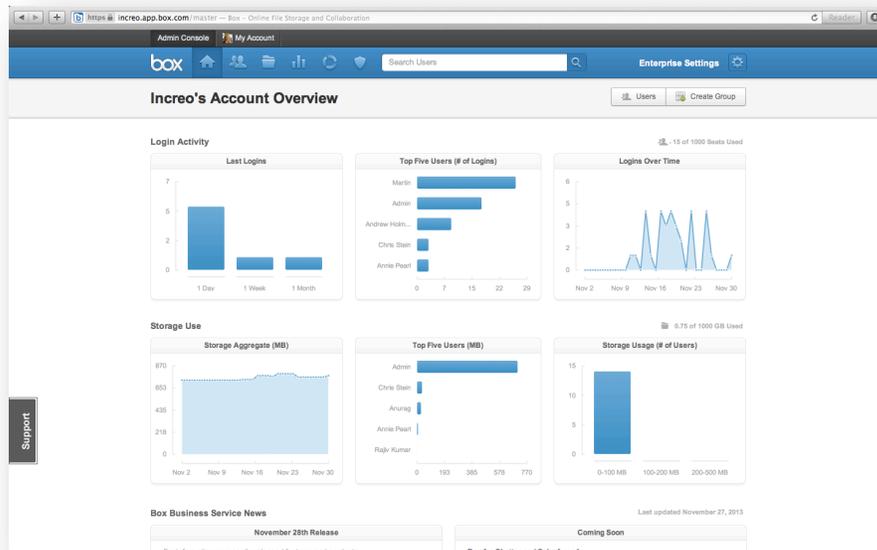

“Box’s security controls and the ability to manage folder access are key for us.”

Brian Davis
President, Net Generation

Enterprise-grade security and control for your business

At Box, we know that enterprise IT solutions demand sophisticated security, powerful admin controls and robust auditing functionality. We also know that for any collaboration tool to be successful, it needs to win over IT, security and end users. Box aims to bridge this divide with simple, powerful solutions for both groups.

Box Business, Enterprise and Elite accounts come equipped with a comprehensive admin console that gives administrators complete control of their accounts. With rich customization and configuration options, Box admins can define and enforce security policies, integrate across their entire IT stack, manage users and groups, control corporate content, generate detailed audit reports and much more.

With Box, you get advanced control over collaboration and file sharing that other tools like email and simple sync-and-share services lack. Plus, Box relieves you of many administrative chores, like managing servers and storage for files and collaboration.

Content Manager: Find and manage content and users in Box

Our enterprise customers often have the challenge of managing very complex deployments, with thousands of users and millions of documents. The content manager tab in the admin console gives admins a powerful set of tools for managing files and users across an organization. It's a powerful command center that gives quick insights into what's going on in your Box account, who is sharing content and with whom, and provides the functionality you need to find issues and take action instantly.

Security Policies: Control what is stored in Box

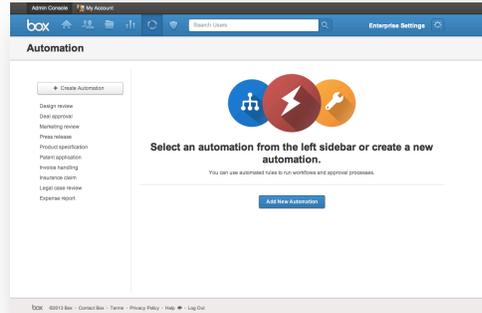

With the security policies tool in Box, admins can directly monitor, control and quarantine the upload of unwanted content into Box, as well as prevent against the loss of sensitive data. Admins can set policies to prevent the upload of confidential information like Social Security Numbers, credit card data, and even specific keywords. Notifications can also be triggered when content unexpectedly leaves Box, or when users from specific domains are added as collaborators to help prevent data loss.

“Box provides valuable administrative features, which let us easily set granular permission controls across all our content and all our users.”

Christopher High
Sales and Marketing
Development, Alere

Automation: Connect content to core business processes

Built on a powerful rules engine, the admin console's automation tools make content in Box more dynamic. As a Box customer, you can create simple rules for automating common processes like invoice approvals, collateral review and contract management. These automation rules make it simple to manage how data and content flows across an organization.

Users and permissions: Create a secure sharing environment

At Box, we do everything we can to help you extend your existing security policies to protect access to corporate content. Admins can modify their accounts' security settings to meet corporate requirements and get the peace of mind that comes from knowing your business information is protected. Through the admin console, you can configure and control password policies, federate groups and identity with Active Directory or SSO, and manage default permissions for sharing.

Reporting: Get true security, visibility and control

In a highly collaborative environment, your security teams needs a set of reporting and monitoring tools to ensure the integrity and availability of your organization's most sensitive content. Through the out-of-the-box reporting and analytics capabilities of the Box admin console, your team gets perfect visibility and deep intelligence over all the content, users, devices and activity across your account. Every user and admin action, including changes to security settings, is logged and available through the reports. Plus, with the Box reporting API, your business can integrate up-to-the-minute information about what's happening with your content into a BI or SIEM tool like Splunk or GoodData.

Devices and connections: Simple, secure mobile management

One of the key advantages cloud collaboration provides your business is access to secure mobile collaboration for your employees. As an admin, your responsibility is now to protect and manage the flow of content between employees, customers and partners -- via an ever-expanding catalog of mobile devices. With features like device pinning, mobile passcode locks, and the ability to directly control offline storage of content on mobile devices, you get the best of both worlds. Accessibility for your teams, enterprise-grade security and mobile management for you.
